

## Cloud Computing Programming Assignment - 1

Name : Tanooj Maram

UCID : tm448

### Procedure

- Obtain AWS Credentials from the Learner lab
- Add the credentials to the credentials file in the .aws on your local machine

```
aws_access_key_id=ASIAYZNIMNT5F2TLM34S  
aws_secret_access_key=X+A6pTTF74/C+vI2jtVbyawbfP/jg9blmA6PLzUq  
aws_session_token=FwoGZXIvYXdzEHMaDDbZAXUlagDcYsx4LiK/AecfY7Q4ev5PQATYNNTThdd6i5Qf
```

- Create 2 instances using the AWS management console in your aws account

Instance A	i-05eb9980e99fb13b0	Running	⊗ 🔍	t2.micro	⌚ Initializing	No alarms	+	u
Instance B	i-08b2120f942d11c27	Running	⊗ 🔍	t2.micro	⌚ Initializing	No alarms	+	u

- Goto EC2 Instance connect and select SSH Client
- Open Putty and connect to two instances separately in two terminals using the same key pair we got while creating instances
- Installing java to run our application on the instance
- Upload jar files to run our application through WinSCP

### Instance 1 ( instance1-1.0-SNAPSHOT.jar )

- To connect to any of the supported services we must provide aws credentials
- First we create Amazon client using our personal aws credentials
- Then we create clients for s3 and rekognition to access the objects from the bucket
- With the help of Rekognition we can detect labels for each object and select only those that has car confidence > 90%
- Then we push these objects that satisfied the condition in to the queue

### Sample Label Data

Below is the label data for one picture where we try to find the object with car confidence more than 90%

```
[{Name: Tree,Confidence: 99.71852,Instances: [],Parents: [{Name: Plant}]}, {Name:  
Plant,Confidence: 99.71852,Instances: [],Parents: []}, {Name: Maple,Confidence:  
99.12696,Instances: [],Parents: [{Name: Tree}, {Name: Plant}]}, {Name: Person,Confidence:  
85.01738,Instances: [{BoundingBox: {Width: 0.037219938,Height: 0.09637587,Left:  
0.39905182,Top: 0.90006566},Confidence: 85.01738}, {BoundingBox: {Width:
```

```

  ____|  ____|  __ )
  _||  (  _/   Amazon Linux 2 AMI
 ____| \____| ____|

https://aws.amazon.com/amazon-linux-2/
[ec2-user@ip-172-31-86-98 ~]$ sudo amazon-linux-extras enable corretto8
 0  ansible2                available      \
    [ =2.4.2 =2.4.6 =2.8 =stable ]
 2  httpd_modules           available      [ =1.0 =stable ]
 3  memcached1.5            available      \
    [ =1.5.1 =1.5.16 =1.5.17 ]
 5  postgresql9.6           available      \
    [ =9.6.6 =9.6.8 =stable ]
 6  postgresql10            available      [ =10 =stable ]
 9  R3.4                    available      [ =3.4.3 =stable ]
10  rust1                   available      \
    [ =1.22.1 =1.26.0 =1.26.1 =1.27.2 =1.31.0 =1.38.0
    =stable ]
11  vim                     available      [ =8.0 =stable ]
18  libreoffice              available      \
    [ =5.0.6.2 15 =5.3.6.1 =stable ]

```

These both instances work in parallel running their own codes. As we have created a FIFO queue , it assures that there won't be any duplications and the messages in the queue are in an ordered manner.
